SWOP – TaskMan iteratie 1

Door Tim Van Den Broecke,

Joran Van de Woestijne,

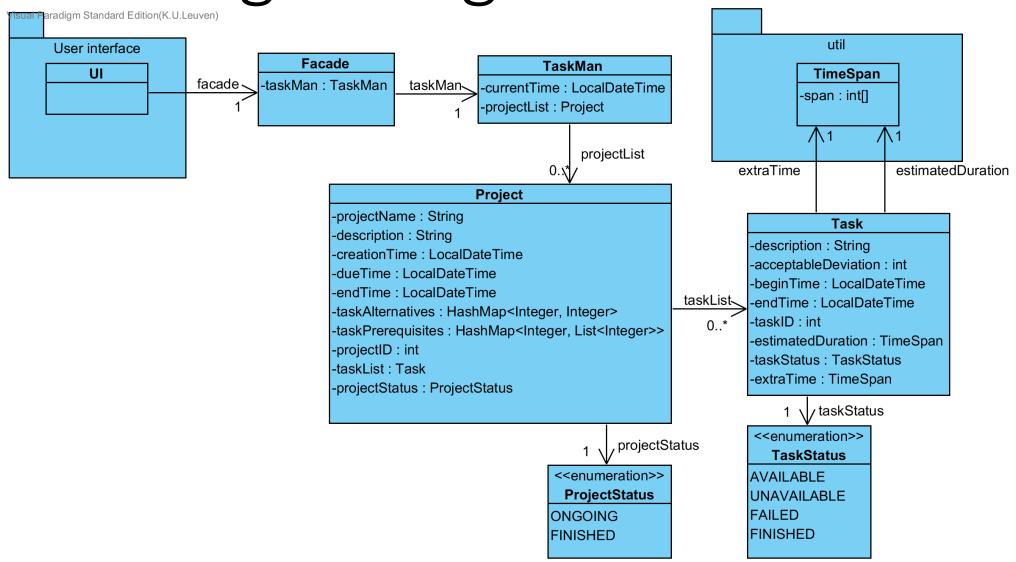

Vincent Van Gestel en

Eli Vangrieken

Inleiding

- 1. High level design
- 2.Detail design
- 3. Domain strength
- 4.Testing

Het design – High level

Het design – Detail TaskMan

```
TaskMan
<< Property>> -currentTime : LocalDateTime
-projectList : Project
-getProject(projectID : int) : Project
+createProject(name: String, description: String, creationTime: LocalDateTime, dueTime: LocalDateTime): boolean
+getProjectName(projectID : int) : String
+getProjectDescription(projectID: int): String
+getProjectCreationTime(projectID: int): LocalDateTime
+getProjectDueTime(projectID : int) : LocalDateTime
+getProjectEndTime(projectID : int) : LocalDateTime
+getProjectStatus(projectID : int) : String
+TaskMan()
+TaskMan(time : LocalDateTime)
+advanceTimeTo(time : LocalDateTime) : boolean
+createProject(name : String, description : String, dueTime : LocalDateTime) : boolean
+createTask(projectID: int, description: String, estimatedDuration: int, acceptableDeviation: int, taskStatus: String, alternativeFor: Integer, prerequisiteTasks: List<Integer>, startTime: LocalDateTime, endTime: LocalDateTime): boolean
+createTask(projectID: int, description: String, estimatedDuration: int, acceptableDeviation: int, alternativeFor: Integer, prerequisiteTasks: List<Integer>): boolean
+getProjectDelay(projectID: int): int []
+getAvailableTasks(): HashMap<Integer, List<Integer>>
+getAvailableTasks(projectID: int): List<Integer>
+getProjectAmount(): int
+getTaskAmount(projectID: int): int
```

Het design – Detail TaskMan (2)

```
+getTaskDescription(projectID : int, taskID : int) : String
+getTaskStartTime(projectID : int, taskID : int) : LocalDateTime
+getEstimatedTaskDuration(projectID: int, taskID: int): int
+getAcceptableTaskDeviation(projectID : int, taskID : int) : int
+hasTaskEnded(projectID : int, taskID : int) : boolean
+getTaskEndTime(projectID: int, taskID: int): LocalDateTime
+getTaskStatus(projectID: int, taskID: int): String
+hasTaskPrerequisites(projectID: int, taskID: int): boolean
+getTaskPrerequisitesFor(projectID: int, taskID: int): List<Integer>
+hasTaskAlternative(projectID: int, taskID: int): boolean
+getTaskAlternativeTo(projectID: int, taskID: int): int
+setTaskFinished(projectID: int, taskID: int, startTime: LocalDateTime, endTime: LocalDateTime): boolean
+setTaskFailed(projectID: int, taskID: int, startTime: LocalDateTime, endTime: LocalDateTime): boolean
+isProjectOnTime(projectID : int) : boolean
+isTaskUnacceptableOverdue(projectID: int, taskID: int): boolean
+isTaskOnTime(projectID : int, taskID : int) : boolean
+getTaskOverTimePercentage(projectID : int, taskID : int) : int
+isProjectFinished(projectID: int): boolean
+isProjectEstimatedOnTime(projectID: int): boolean
+getEstimatedProjectDelay(projectID : int) : int []
-isValidProjectID(PID: int): boolean
```

Het design – Detail Project

```
Project
-description : String
-creationTime : LocalDateTime
-dueTime : LocalDateTime
-endTime : LocalDateTime
-taskAlternatives : HashMap<Integer, Integer>
-taskPrerequisites: HashMap<Integer, List<Integer>>
-taskList : Task
-projectStatus : ProjectStatus
-projectID: int
-projectName: String
+Project(projectID: int, projectName: String, description: String, creationTime: LocalDateTime, dueTime: LocalDateTime)
-updateTaskStatus(task : Task) : void
-getTask(taskID : int) : Task
-isValidTaskID(taskID: int): boolean
+getProjectDescription(): String
+getProjectCreationTime(): LocalDateTime
+getProjectDueTime(): LocalDateTime
+getProjectEndTime(): LocalDateTime
+getAllAlternatives(): HashMap<Integer, Integer>
+createTask(description: String, estimatedDuration: int, acceptableDeviation: int, taskStatus: String, alternativeFor: int, prerequisiteTasks: List<Integer>, startTime: LocalDateTime; endTime: LocalDateTime): boolean
+createTask(description: String, estimatedDuration: int, acceptableDeviation: int, alternativeFor: int, prerequisiteTasks: List<Integer>): boolean
-recalculateProjectStatus(): void
+getProjectStatus(): String
+getTasklDs(): ImmutableList<Integer>
+hasAlternative(taskID : Integer) : boolean
-addAlternative(toReplace: int, alternative: int): boolean
-isValidAlternative(toReplace : int, alternative : int) : boolean
-addPrerequisites(taskID: int, pre: List<Integer>): boolean
-isValidPrerequisites(task: int, prerequisites: List<Integer>): boolean
```

Het design – Detail Project (2)

```
+getTaskAmount(): int
+getAvailableTasks(): List<Integer>
+getTaskDescription(taskID: int): String
+getTaskStartTime(taskID : int) : LocalDateTime
+getEstimatedTaskDuration(taskID: int): int
+getAcceptableTaskDeviation(taskID : int) : int
+hasTaskEnded(taskID : int) : boolean
+getTaskEndTime(taskID : int) : LocalDateTime
+getTaskStatus(taskID: int): String
+hasPrerequisites(taskID : int) : boolean
+getPrerequisites(taskID: int): List<Integer>
+isOnTime(current : LocalDateTime) : boolean
+getDelay(current : LocalDateTime) : int []
+setTaskFinished(taskID: int, startTime: LocalDateTime, endTime: LocalDateTime): boolean
+setTaskFailed(taskID: int, startTime: LocalDateTime, endTime: LocalDateTime): boolean
+getExtraTime(taskID : int) : TimeSpan
-hasFinishedAlternative(task : int) : boolean
-isValidNewTaskID(taskID : int) : boolean
+getAlternative(task: int): int
+isTaskUnacceptableOverdue(taskID : int) : boolean
+isTaskOnTime(taskID : int) : boolean
+getTaskOverTimePercentage(taskID: int): int
+isFinished(): boolean
+getEstimatedProjectDelay(currentTime : LocalDateTime) : int []
-getMaxDelayChain(taskID: int): TimeSpan
-isPrerequisite(taskID : int) : boolean
-getDependants(taskID : int) : List<Integer>
+isEstimatedOnTime(currentTime : LocalDateTime) : boolean
-hasAvailableTasks(): boolean
```

Het design – Detail Task

```
Task
<< Property>> -description : String
<<Pre><<Pre>roperty>> -acceptableDeviation : int
<<Pre><<Pre>roperty>> -beginTime : LocalDateTime
<<Pre><<Pre>roperty>> -endTime : LocalDateTime
<< Property>> -taskID : int
-taskStatus : TaskStatus
-extraTime : TimeSpan
-estimatedDuration : TimeSpan
+isFinished(): boolean
+getTimeElapsed(currentTime : LocalDateTime) : TimeSpan
+getTimeSpan(): TimeSpan
+Task(taskID: int, taskDescription: String, estimatedDuration: int, acceptableDeviation: int, extraTime: TimeSpan)
+isFailed(): boolean
+isAvailable(): boolean
+isUnavailable(): boolean
+hasEnded(): boolean
+setBeginTime(beginTime : LocalDateTime) : void
+setEndTime(endTime : LocalDateTime) : void
+setAvailable(): boolean
+setUnavailable(): boolean
```

Het design – Detail Task (2)

```
-getTaskStatus(): TaskStatus
+getTaskStatusName(): String
+getStatus(): String
+setTaskFinished(startTime: LocalDateTime, endTime: LocalDateTime): boolean
+setTaskFinished(startTime: LocalDateTime, endTime: LocalDateTime): boolean
+setTaskStatus(startTime: LocalDateTime, endTime: LocalDateTime): boolean
-setTaskStatus(startTime: LocalDateTime, endTime: LocalDateTime): boolean
-isValidTimeStamps(startTime: LocalDateTime, endTime: LocalDateTime): boolean
+Task(taskID: int, taskDescription: String, estimatedDuration: int, acceptableDeviation: int, taskStatus: String, beginTime: LocalDateTime, endTime: LocalDateTime, extraTime: TimeSpan)
-isValidTaskID(taskID: int): boolean
-isValidTaskID(taskID: int): boolean
-isValidDuration(duration: String): boolean
+isValidDuration(duration: int): boolean
+isOnTime(): boolean
+isUnacceptableOverdue(): boolean
+getOverTimePercentage(): int
```

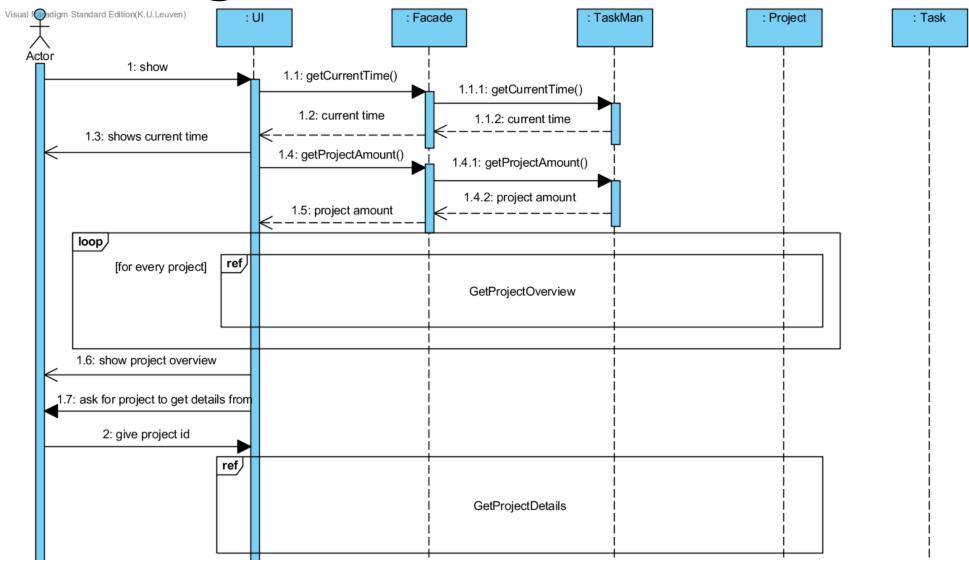

Het domein – Uitbreidbaarheid

Gebruik van facade UI onafhankelijk van het systeem

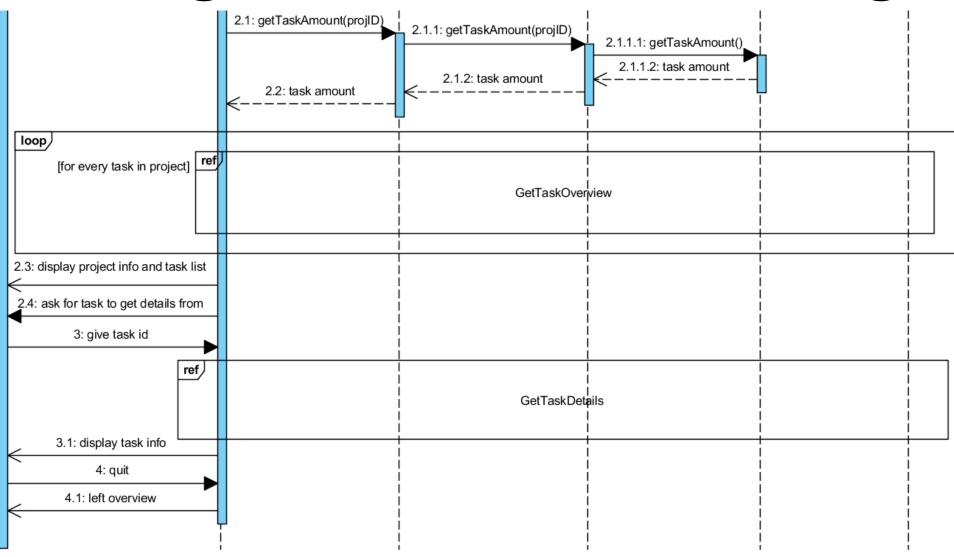

Aanpassingen kunnen zeer lokaal gebeuren

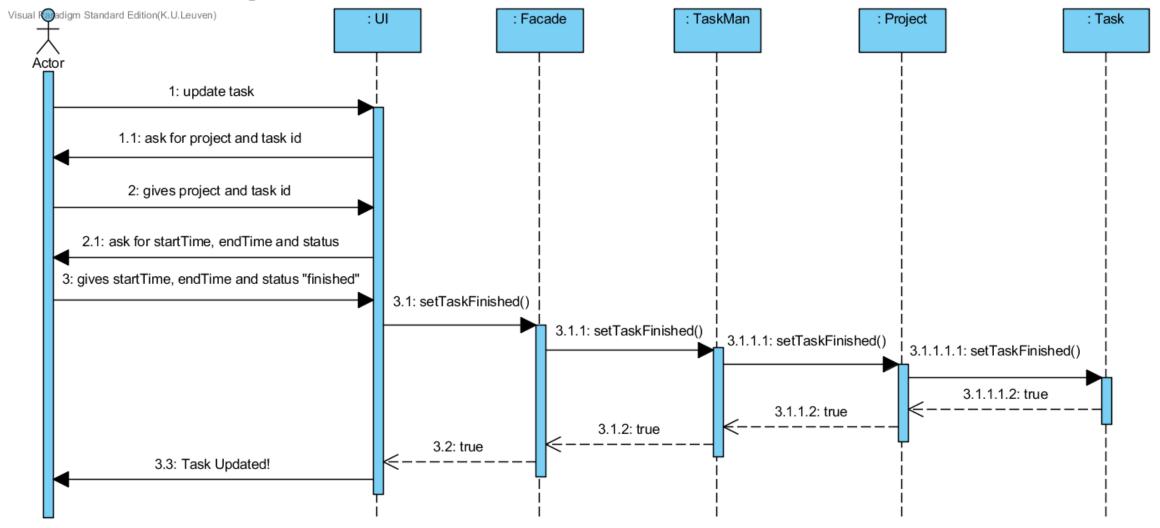

Het domein - Robuustheid

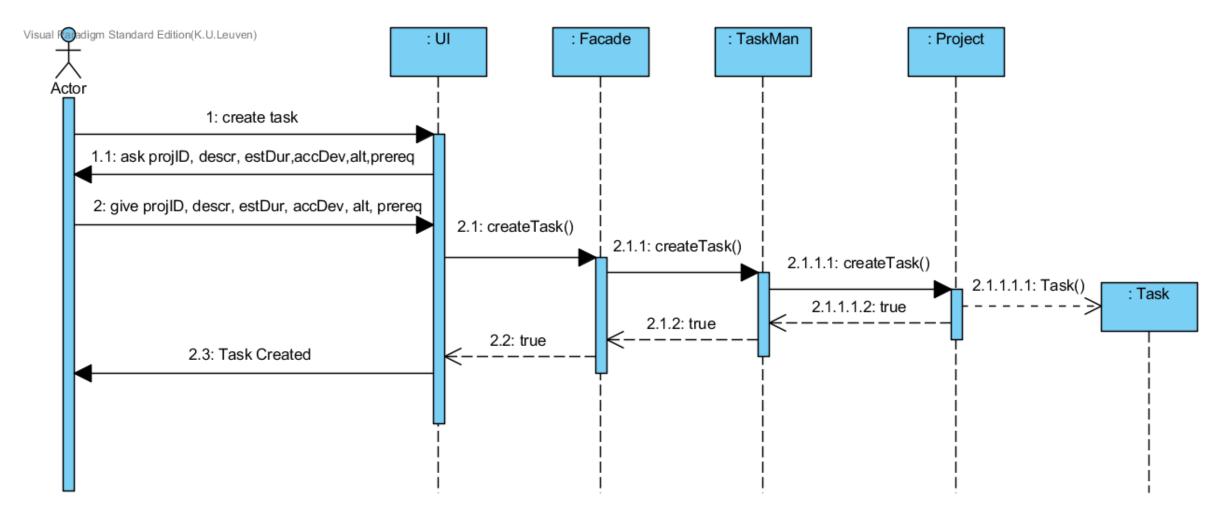

Grote nadruk op defensiviteit null correcte identifiers geen inconsistentie

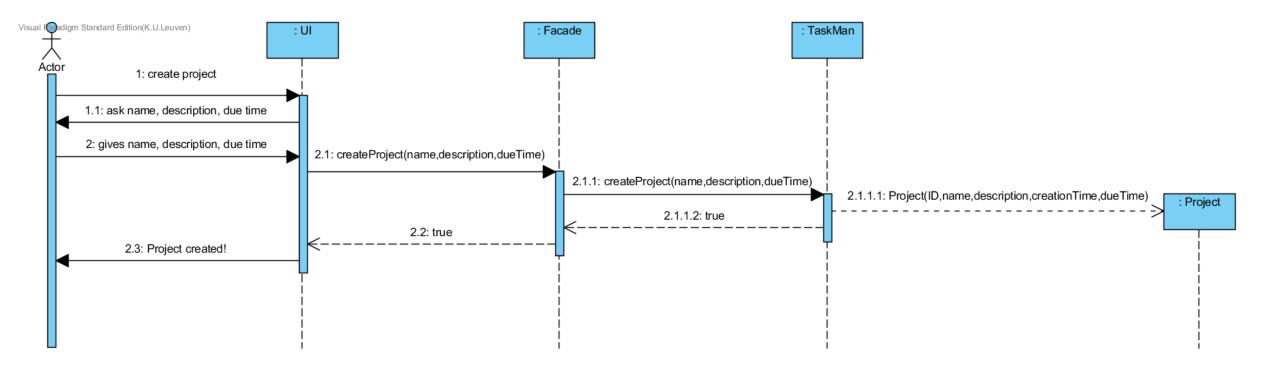

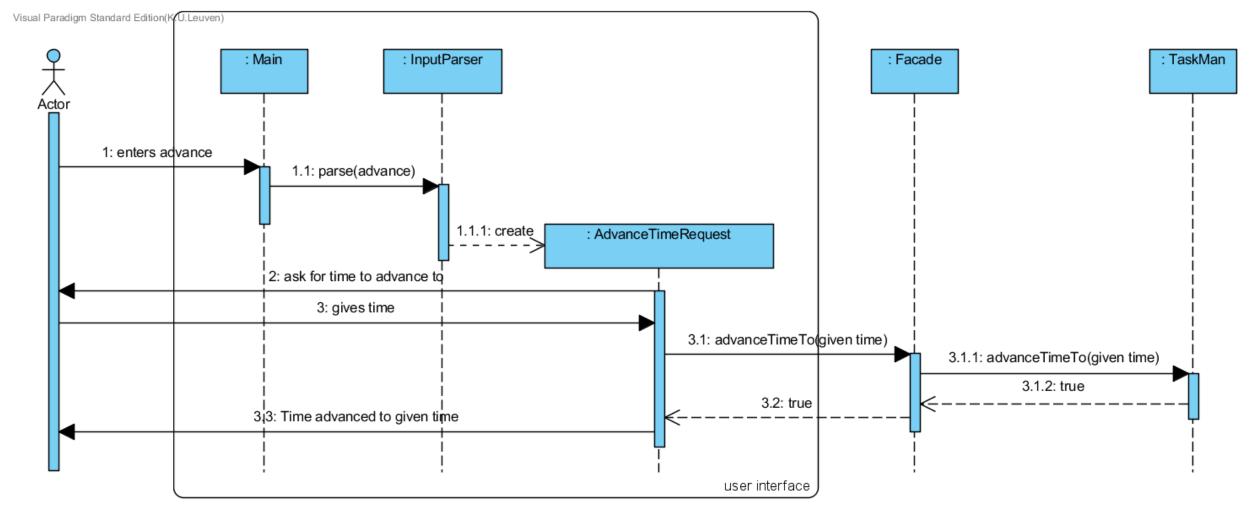

Testing – Use Case 1 vervolg

Testing - Testsuite

Demonstratie

Toekomstige aanpassingen

Tijdsberekening verbeteren

Hierarchie toevoegen aan Task

Werkverdeling
